Ozone – an introduction

Ozone has been used for disinfection of drinking water in the Municipal Water Industry in Europe for over 100 years and is used by a large number of Water Companies, where ozone generator capacities in excess of 100 kg/h are common.

Ozone can be used for water and air treatment

Ozone – safe for the environment with the proper ozone generator system

Because ozone is made of oxygen and reverts to [pure oxygen](#), it vanishes without trace once it has been used. Compare this with other disinfectants.

When ozone disinfects or breaks down harmful bacteria or pollutants, there are generally no by-products, unlike most disinfecting agents.

For further information about ozone click on [Ozone data](#)

Please choose any of the left links for application data and specific ozone technologies.
